Mixing Division

Industrial Mixers

 **ATEX RANGE AVAILABLE**

Quality and Innovation

MIX PRODUCTS AND SOLUTIONS

MIX designs and manufactures Mixers, Stirred Bunkers, Granulators, Heaters, Coolers, Dryers, Reactors and Sterilisers. Gross capacity from 2 to 30 litres for laboratory mixers and from 75 to 13,000 litres for industrial mixers. On request up to 50,000 litres, for batch or continuous processes with the aid of different types of mixing tools. (ploughshare, MIX-paddles, fourfold screw ribbon) and optional components.

Construction material: AISI 304(L) - AISI 316(L) - AISI 316(Ti), carbon steel, wear-resistant steel.

Industry application: Foodstuff, Chemical-Cosmetic, Construction, Ecology, Industrial, Laboratory-Pilot Machinery, Animal feed.

The products comply with European Directive 2006/42/EC and on request EU Directive 2014/34/EU (formerly 94/9/EC) and 97/23/EC (ATEX and PED).

MIXING WITH THE RIGHT PARTNER

Customers purchasing MIX products obtain Technology - Experience - Support and industrial patented solutions with undeniable advantages with regards to Technical, Economic and Prestige. Mix is Project creativity.

Operation

The purpose of the Mixer is to mix / blend different powdered, granule, fibre and paste products with possible addition of liquids, optimising the blend mix obtained, ensuring process control and consistency of the result. In addition the holding tank maintains the homogeneity / fluidity of the mix avoiding demixing; the Granulator granulates the powder particles, activating it with the suitable amount of liquids; The Heater / Cooler controls the temperature of the mix: the Dryer dries the moist products (powder or paste); the Reactor promotes and controls the physical and chemical reactions between the products; the Steriliser, sterilises through high temperatures and pressure the mixture.

EXCLUSIVE PROJECT FUNCTIONAL TO THE PROCESS

The need to obtain processes with high mix homogeneity, with controlled and consistent quality, able to satisfy the different market demands, both for known and innovative products, has inspired the MIX technicians to design a range of machines with different compliance, responding to the specific needs of each individual process.

THE PRINCIPLE OF THREE-DIMENSIONAL MECHANICAL FLUIDISATION

The ploughshare horizontal mixer works on a principle of “Three-Dimensional Mechanical Fluidisation” (centrifugal whirling of the products). This is done with the use of the Ploughshare-shaped mixing tools that cause high turbulence with the result of a rapid and precise interpenetration / homogenisation of the various mixing components (regardless of their physical characteristics), thus avoiding dangerous stops / machine downtime as a result of product build-up.

Mixing Process

BATCH

"Batch" process means discontinuous, the simplified production sequence is the following:

- venting spigot must always be open to vent air in a filter, preferably slightly under pressure;
- filling through the product inlet, with the unloading door closed;
- mixing, with unloading door closed, product inlet closed or open only if connected with a closed feeding hopper;
- emptying of the mixed product through the unloading door.

CONTINUOUS

"Continuous" process. The machine can be outlined as an open system; the production sequence consists in a flow of product that enters from the loading inlet, then it is mixed, and exits from the unloading outlet. Both inlet and outlet doors are always open. Therefore, it is important to remember that the final product quality depends on the permanence inside the mixing chamber and on the volume of product in the processing phase.

Mixing Tools

The rotor shaft with tools, can be a single block obtained by welding, radially fixed at both ends and axially fixed only on the drive side, or the tools can be bolted to the rotor shaft with special self locking bolts. The rotor shaft has a suitably dimensioned structure, according to the products and the process planned. The specific shape of the tools is conceived to obtain the required mixing, homogenisation, granulation, aeration, depending on the mixed products.

DEPENDING ON THE DIFFERENT PRODUCTS TO BE MIXED, THE FOLLOWING MIXING TOOLS ARE PROVIDED:

PLOUGHSHARE

Are composed by two symmetrical plough-shaped faces. The space between the two faces is closed with a specially shaped metal sheet to prevent the wedging of the product. This tool works on the principle of mechanical fluidisation (centrifugal whirling of the products) and obtains excellent mixing quality in a very short time.

MIX PADDLE

Mix Paddles require a longer mixing time than ploughshare, but are easier to clean, paddles are normally used with pastes and moist or sticky products.

SCREW (RIBBON)

The fourfold screw ribbon is used for non intensive and gentle mixing or to keep the product agitated to avoid lumps. It is used also to homogenise different batches obtained with ploughshare or paddle intensive mixers in a single batch.

Technical Data Sheets

N-MXA A-MXA Ploughshare Continuous Mixer

On request it is possible to supply mixers with many product inlets.

Unloading Door

OPEN

TOROIDAL UNLOADING DOOR

The door rebuilds the circular shape of the mixing chamber, preventing the formation of areas where the product remains unmixed. The particular profile of the small, self cleaning gasket guarantees the perfect seal even with sticky products such as oxides for pigments, sugar and flour with fats.

CLOSED

BOMB UNLOADING DOOR

The door rebuilds the circular shape of the mixing chamber, preventing the formation of areas where the product remains unmixed. Bomb unloading makes it possible to obtain complete emptying of the mixer in a few seconds and it is such to guarantee the perfect seal, even with heavy products and rotor in movement, thanks to an additional closure reinforcement system.

FRONT UNLOADING DOOR

The front unloading outlet with slide valve has been designed to adjust the time the products remains inside the mixing chamber.

Process-Specific Solutions

HEAT EXCHANGER

MIX heat exchanger has a very high performance thanks to the heating / cooling fluid that is directly in contact with the mixing chamber. The exchange fluid: glycol water, cold water, hot water, hot oil, steam, has the function to take on or to transfer heat from the product inside the product being mixed, obtaining heating / cooling or drying. In the reactors, the heat exchange allows the chemical and physical reactions to be controlled, accelerating or delaying them.

PNEUMATIC CLEANING OF THE MIXING CHAMBER

This system, protected by an Italian patent, injects compressed air inside the mixing chamber, while the rotor shaft is running. The nozzles, installed on the back of the ploughshares project the air against the wall of the mixing chamber, making the product to detach from the mixer walls. The combination of pneumatic cleaning system with the boom unloading door allows a very high degree of cleaning of the machine, after unloading, without operator intervention.

CHAMBER CLEANING WITH EXTRACTABLE ROTOR

The solution with fully extractable rotor shaft on suspended guides allows the operator to easily access each point within the mixing chamber, allowing complete cleaning of the same and the rotor shaft. An excellent solution for use in industries where cleaning of the equipment after every recipe change is of fundamental importance.

SAMPLER

The Pneumatic sampler system allows samples to be collected; during the mixing phase, while the rotor shaft is running. The sampler, with easy and repetitive operations, is installed on the head of the mixer, avoiding the formation of product settling areas.

CHOPPERS AND LIQUID INJECTION SYSTEM

Side mounted choppers are equipped with high speed rotating blades that facilitate the homogenisation of different products, reducing the mixing time and breaking any lumps. Liquid Injection has the function to add products inside the mixer and to facilitate the elimination of powder and the granulation process.

MIX SEAL

The MIX Seals of rotor-shaft, has the following components: a solid base in cast iron, wear-resistant bushing on the rotor shaft, synthetic or certified packing gland for Food, fluid insufflation duct (dehumidified air or inert gas), two half aluminium or stainless steel stuffing box for easy maintenance.

CHOPPERS FOR FOOD INDUSTRY

These MIX choppers are designed for use where anti-settling solutions of the product and facilitated sanitisation of the contact parts are required. They consist of: hub reconstructing the circularity of the mixing chamber, quick disconnection flange with safety clamp, homogeniser removal sensor signal, air-purged seal with temperature probe, different interchangeable knives and high-efficiency inverter motors (IE4).

NOTE: Height expressed in mm, if not specified otherwise. The company MIX reserves the right to make changes without prior notice. All sizes shown are approximate. The values are intended with tolerances resulting from normal production fluctuations. In special cases, and for precise values, our written confirmation is required.
